Artist Statement

The project at hand was tasked to learn about 3D modeling and electronics, which has been achieved. The intention was to understand and demonstrate basic skills with cad and to come up with an idea and bring it to life. The model created would be 3D printed, then circuit boards would be made in order to give the physical model the ability to light up and become life-like. I chose to create an ice cream cone for this project, as I thought it would be fun and intricate to work with. The model would stand upright on a box provided, which would also hide away the circuit board and wiring, so it was especially important to think about that factor in the creation of it. I had to add other elements of an ice cream scoop and an ice cream tub for this specific reason, becuse the ice cream cone itself would not be able to support itself on its own. The other elements seem to fit nicely with the original, and even adds to the overall project. The project felt like a success in learning basic knowledge of modeling and electronics, as well as demonstrating that knowledge in a unique way.

Project Reflection

The project was a great learning and building experience, giving knowledge that is beneficial. It was an overall opportunity to learn about what goes into making models and basic circuit boards that can hold great importance down the line, especially in my career and others alike. It was also an opportunity to work in new programs and practice techniques, along with thinking strategically about how the model and overall project would appear. This was a challenge as a whole, as I had to essentially re-think my model and determine what to change or add to work with how it would be presented later on. This problem was also present in the circuit building process of the project, because I had to think about how far I wanted my LEDs to extend into my model, in which I had to redo to get the desired length. The project had minor learning curves, but it was overall very informative and hands-on, as well as beneficial knowledge that is useful in the art world and in general.
